

Part I

„... given the general tendency of African languages towards postposing the modifiers to the noun and the well-known fact, that in comparison with other types of modifiers, relative clauses are particularly prone to follow the noun they modify. Consequently, **the predominance of the relativisation strategy in which embedded relatives are treated as noun modifiers that follow the noun they modify, already noted at world level, is particularly strong among African languages**” Creissels (2000:256).
