

Areal alignment and the diversification of Bua languages (Chad)

Florian Lionnet
Princeton University

*Workshop: “West-central African linguistic history between Macro-Sudan Belt and Niger-Congo:
Commemorating Diedrich Westermann’s legacy and the 100th anniversary of the Berlin
professorship for African languages”*

Humboldt University, Berlin, 4-6 November 2021

Introduction

- Strong areal skewing in distribution of linguistic features in Northern-Sub-Saharan Africa
 - Macro-areal: (Macro)-Sudan(ic) Belt
(Güldemann 2003, 2008, 2010, 2018; Clements & Rialland 2008)
 - Meso-areal, e.g. Central Africa
(Dryer 2009, Idiatov 2018, Güldemann 2018: 457; Rolle, Lionnet & Faytak 2020, a.o.)
 - Micro-areal (in local, small-scale multilingual settings)
- Areal signals are strong and relatively stable over time, migrating languages adapt to local areal profiles, as we saw earlier (Lionnet & Rolle, this workshop)

Introduction

- Goal of this talk: illustrate the inner workings of areal alignment, with a detailed case study of Bua languages (southern Chad)
- A subset of Bua languages underwent radical phonological restructuration as a result of alignment to the phonological profile of
 - their micro-area (languages in immediate contact)
 - their meso-area (Central Africa)

Introduction

- Important acknowledgment: this is based on joint work with:
 - Pascal Boyeldieu, Ulrich Kleinewillinghöfer, and Raimund Kastenholtz (Bua comparative database, in progress)
 - Nik Rolle and Matt Faytak (Areal distribution of vowel systems)

Introduction

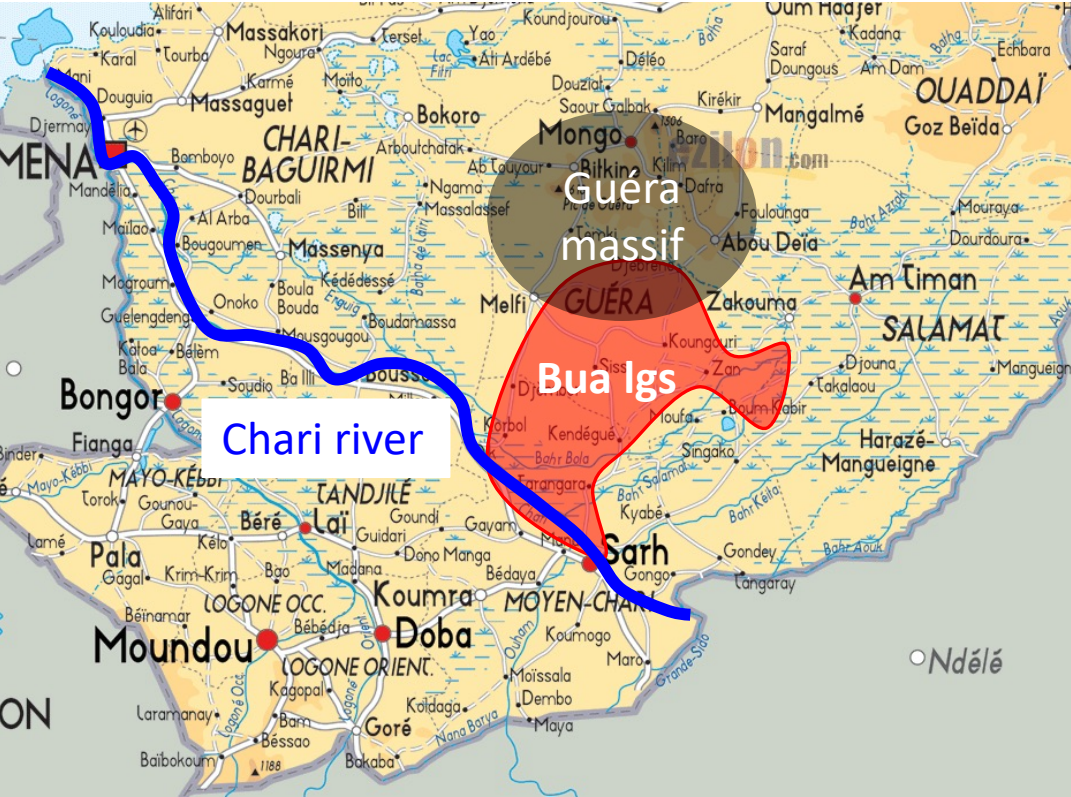

- Roadmap:
 1. Intro to **Bua** languages
 2. Areal alignment of **vowel** systems
 3. Areal alignment of **plosive** systems
 4. The role of **contact**
 5. Conclusions and open questions

1 Bua languages

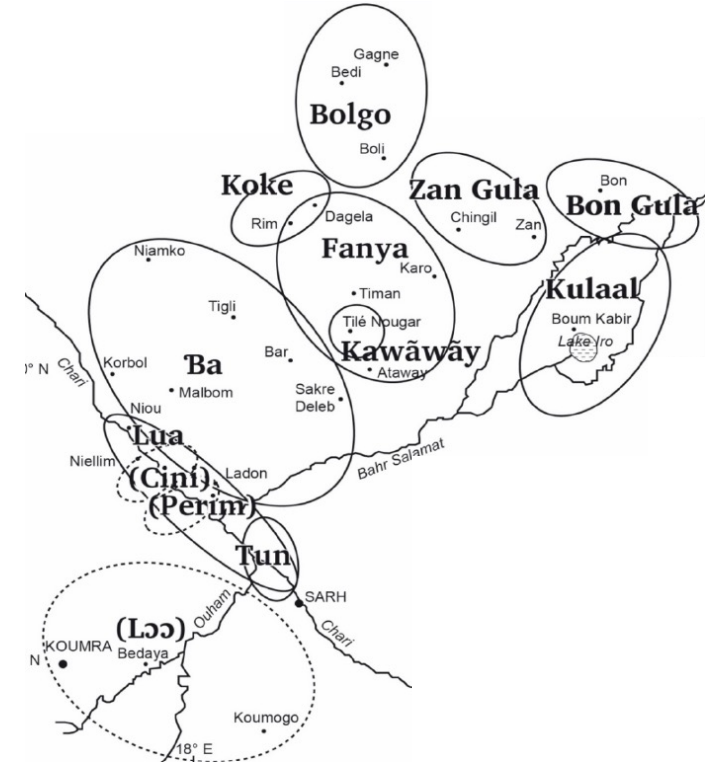

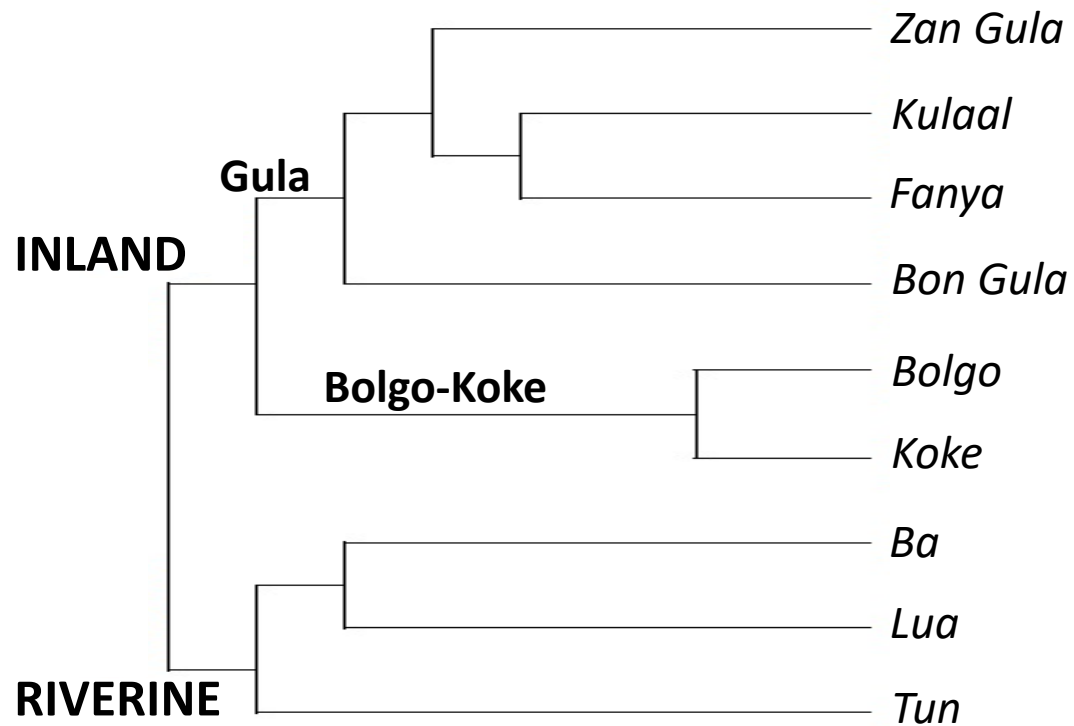

1 Bua languages

- 9 extant languages + three no longer spoken
- Clear genealogical unit
- Clearly Niger-Congo (lexicon, reconstructed noun class system with clear cognates and parallels with Gur)
 - Subsumed under “Adamawa”, of unclear classificatory status
- Spoken in South-central Chad (easternmost “Adamawa” group)
- Comparative work underway, with tentative classification and reconstructions (Boyeldieu 1986, Boyeldieu et al 2018, 2020)

1 Bua languages

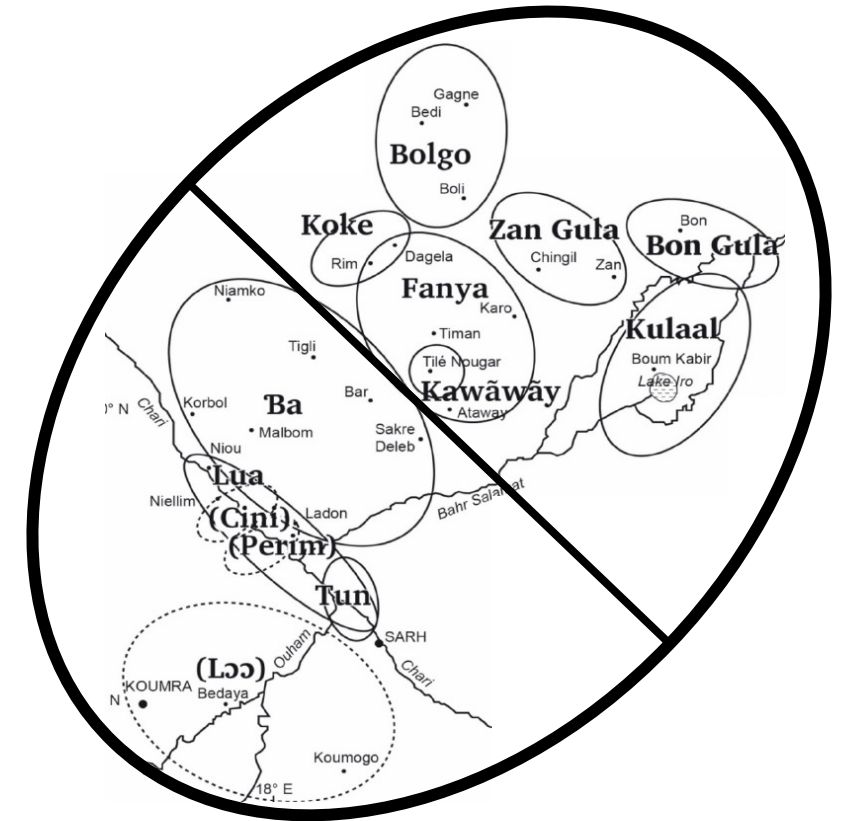

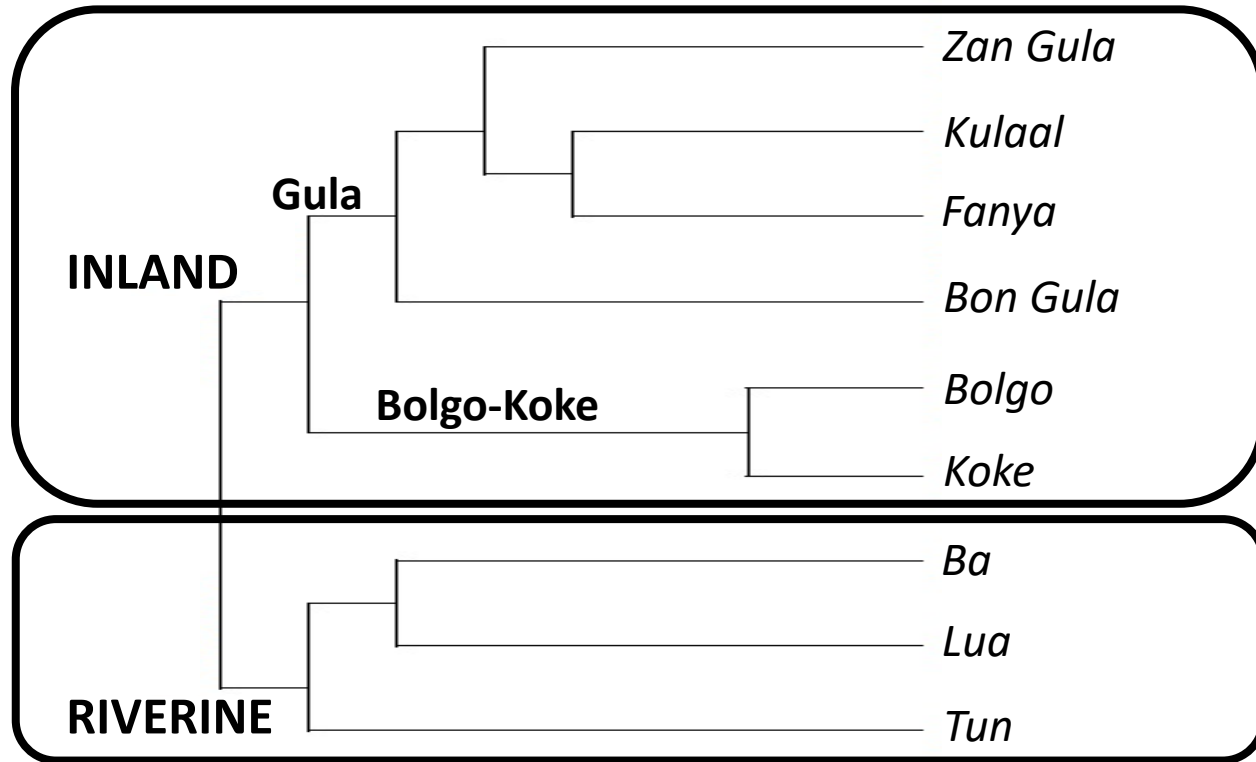

1 Bua languages

Lexicostatistical classification (branch average)

1 Bua languages

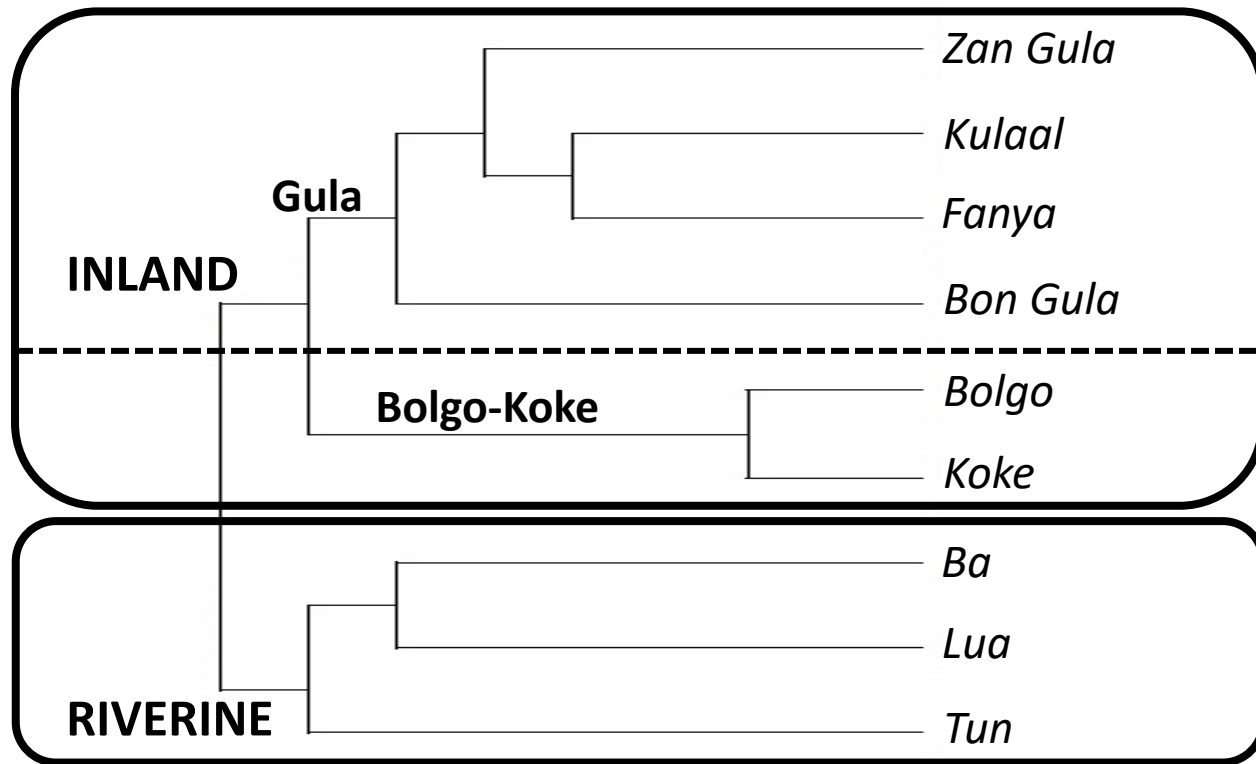

INLAND

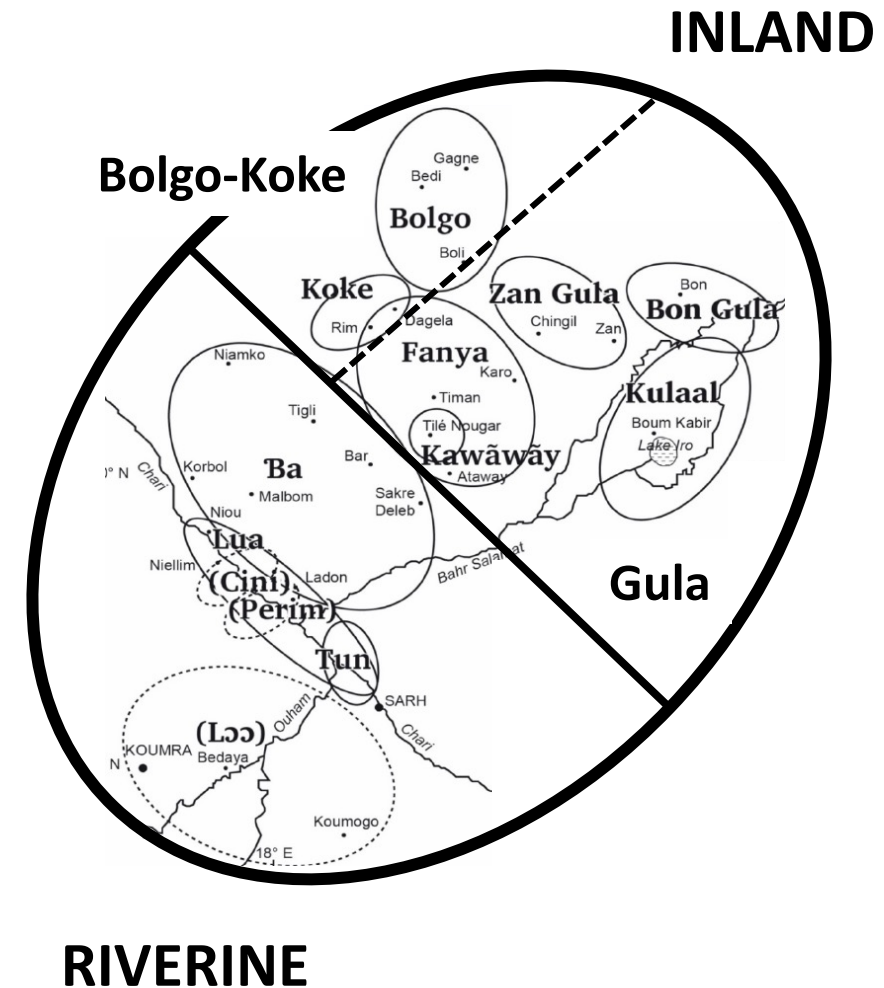

RIVERINE

Lexicostatistical classification (branch average)

1 Bua languages

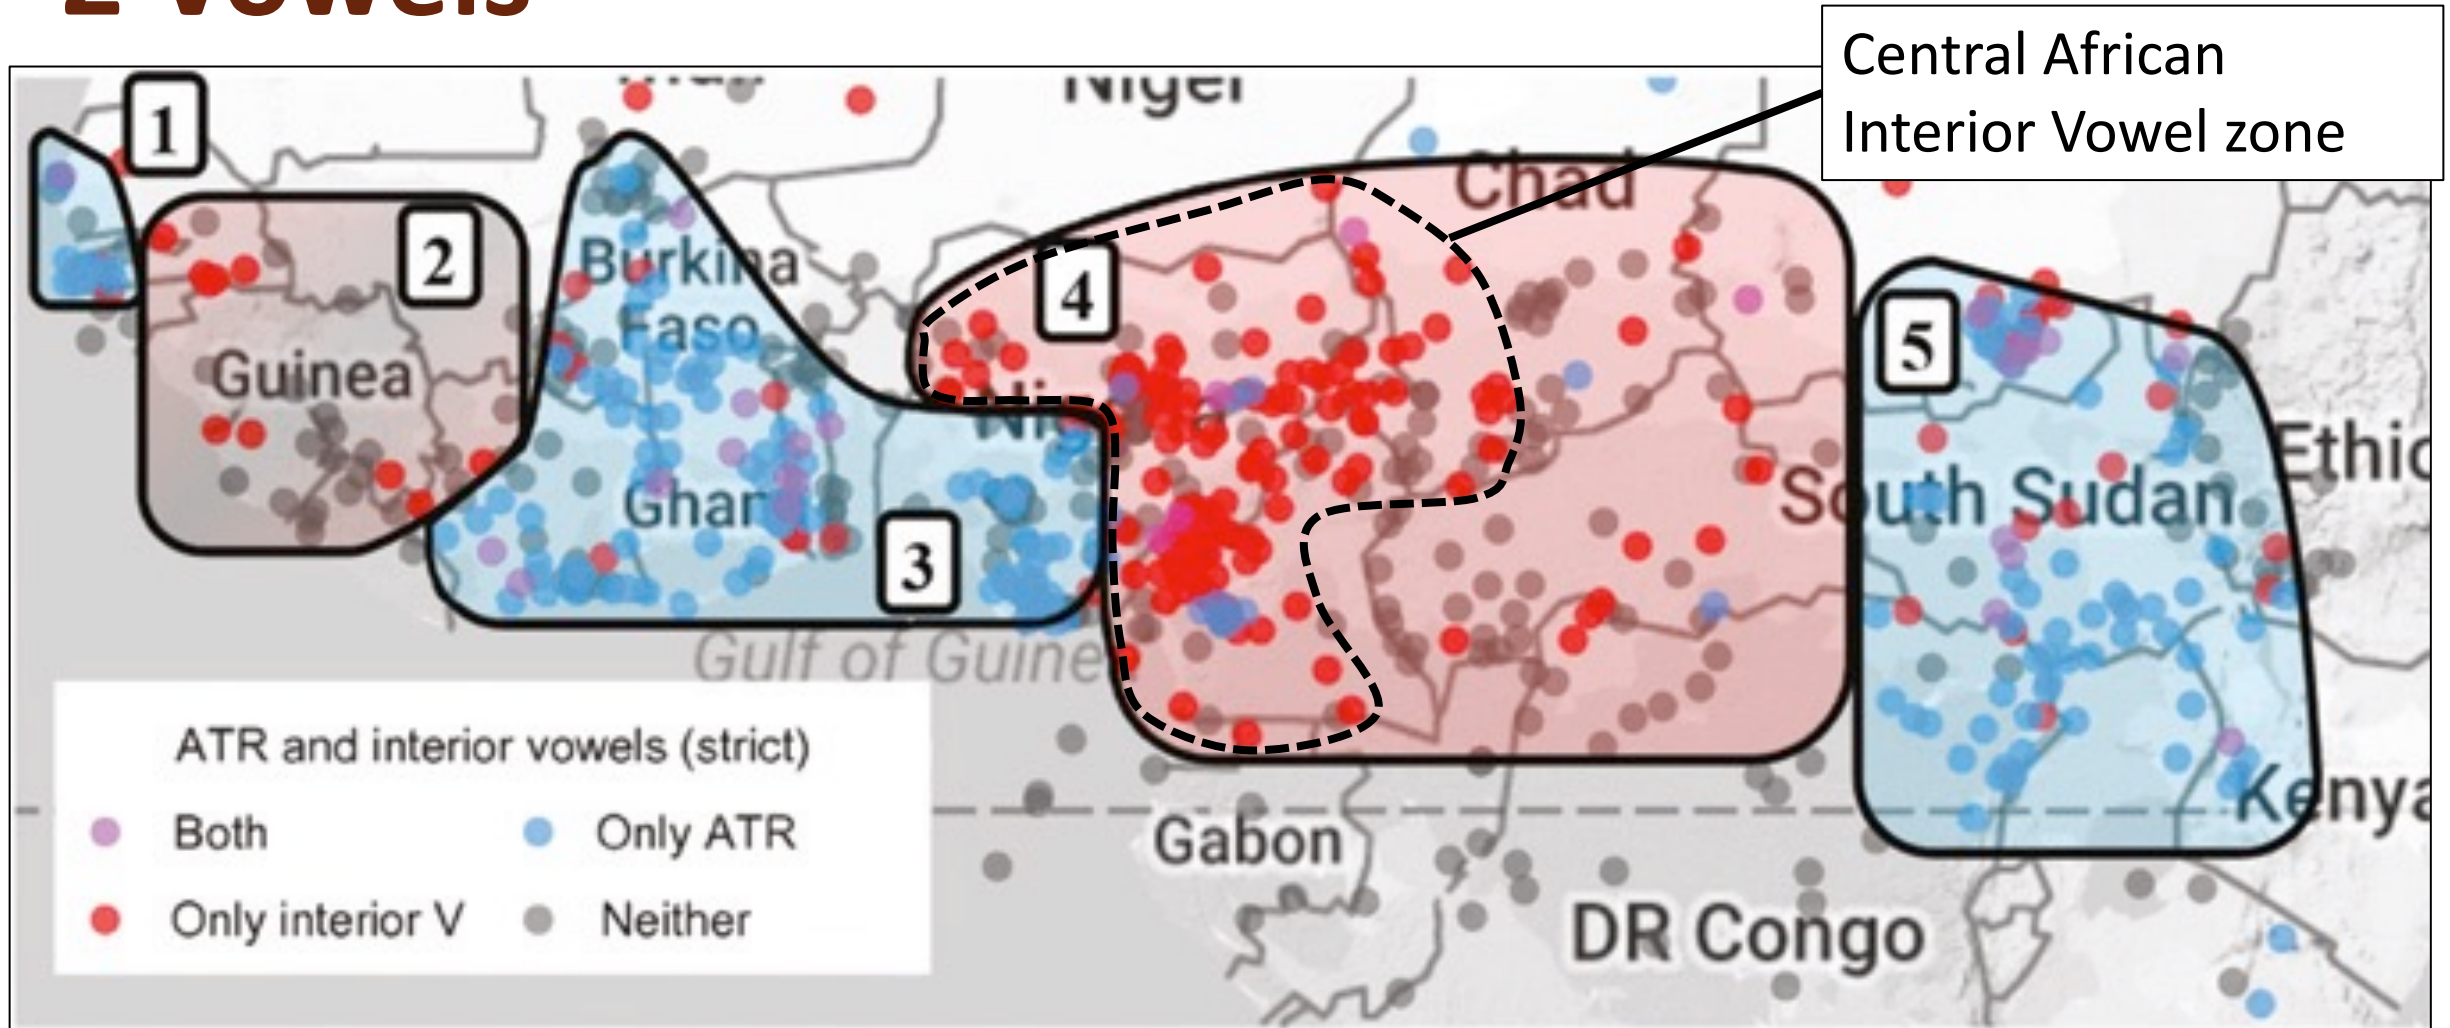

Lexicostatistical classification (branch average)

2 Areal alignment of Bua vowel systems

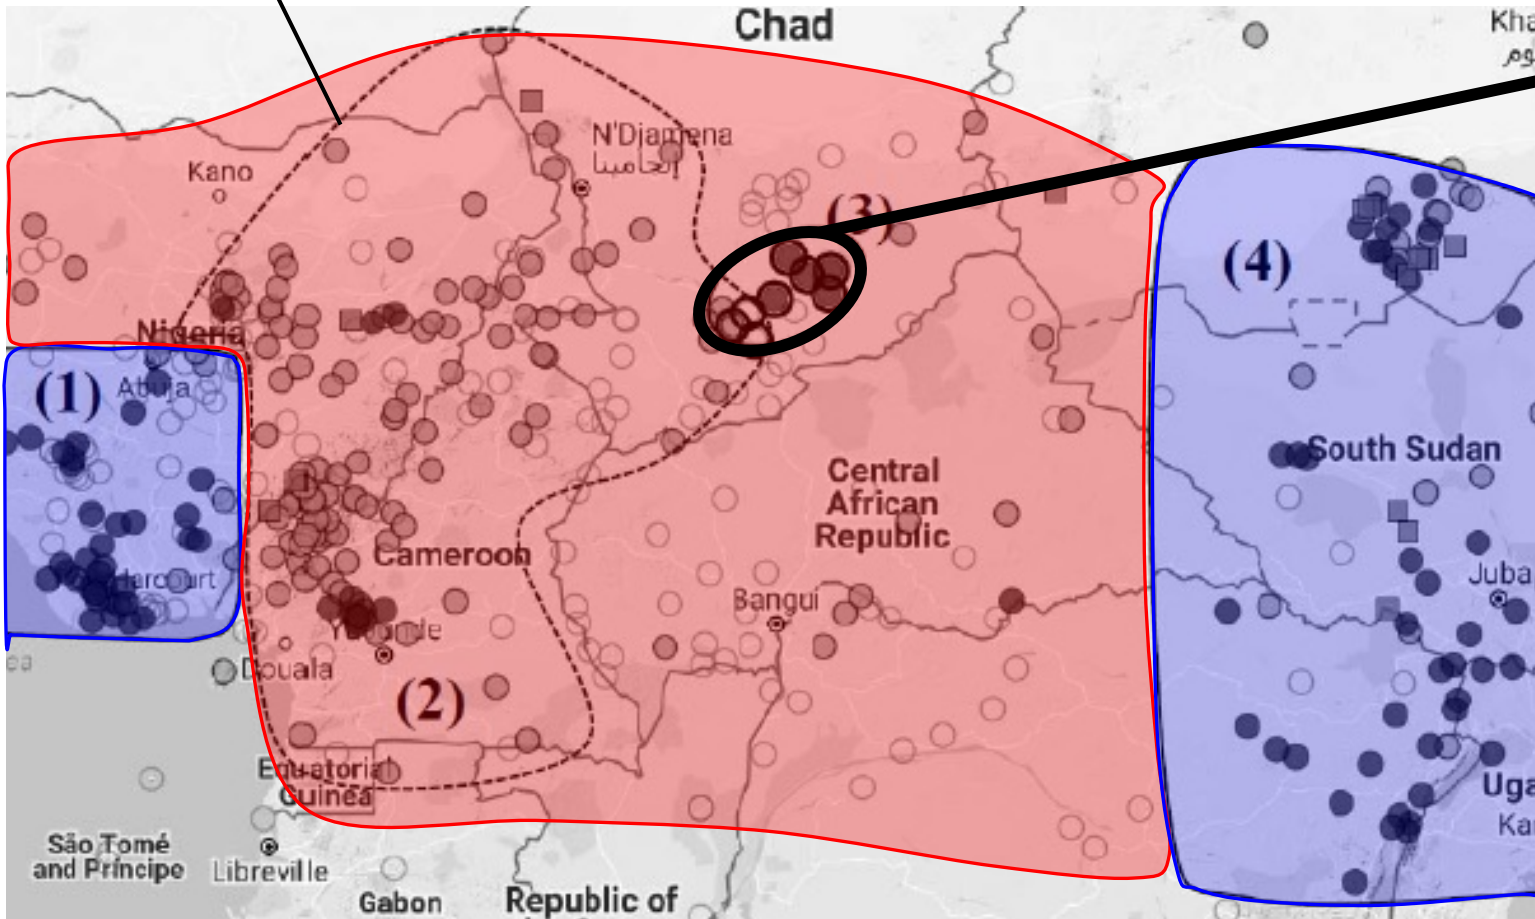

2 Vowels

2 Vowels

- ATR contrast and harmony
- No interior vowels

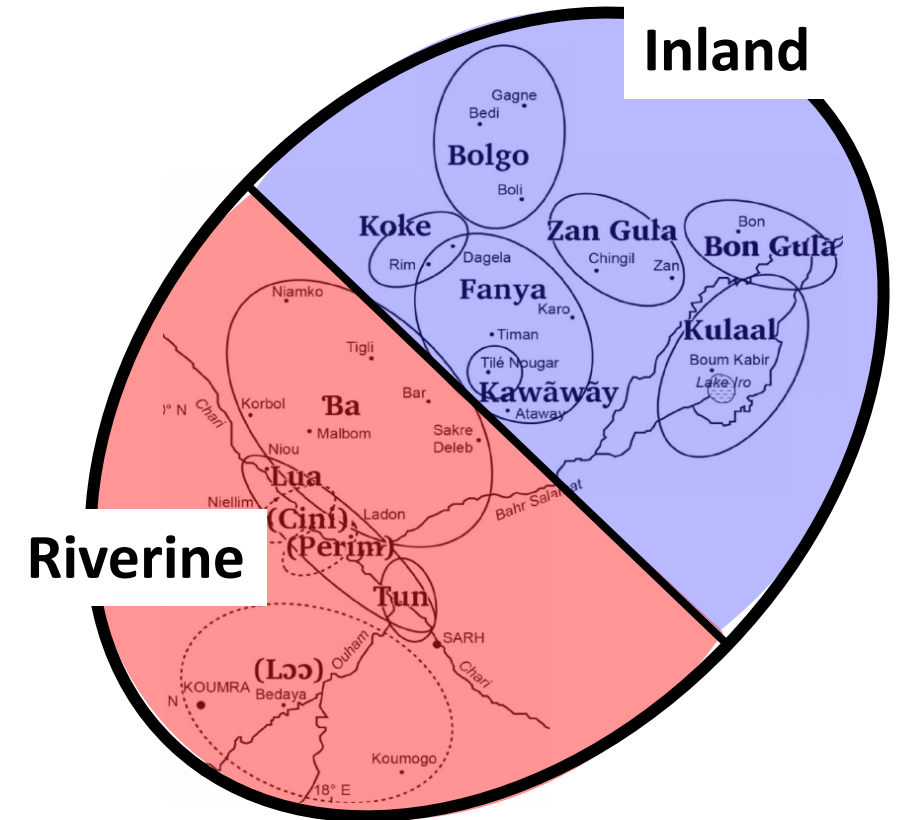

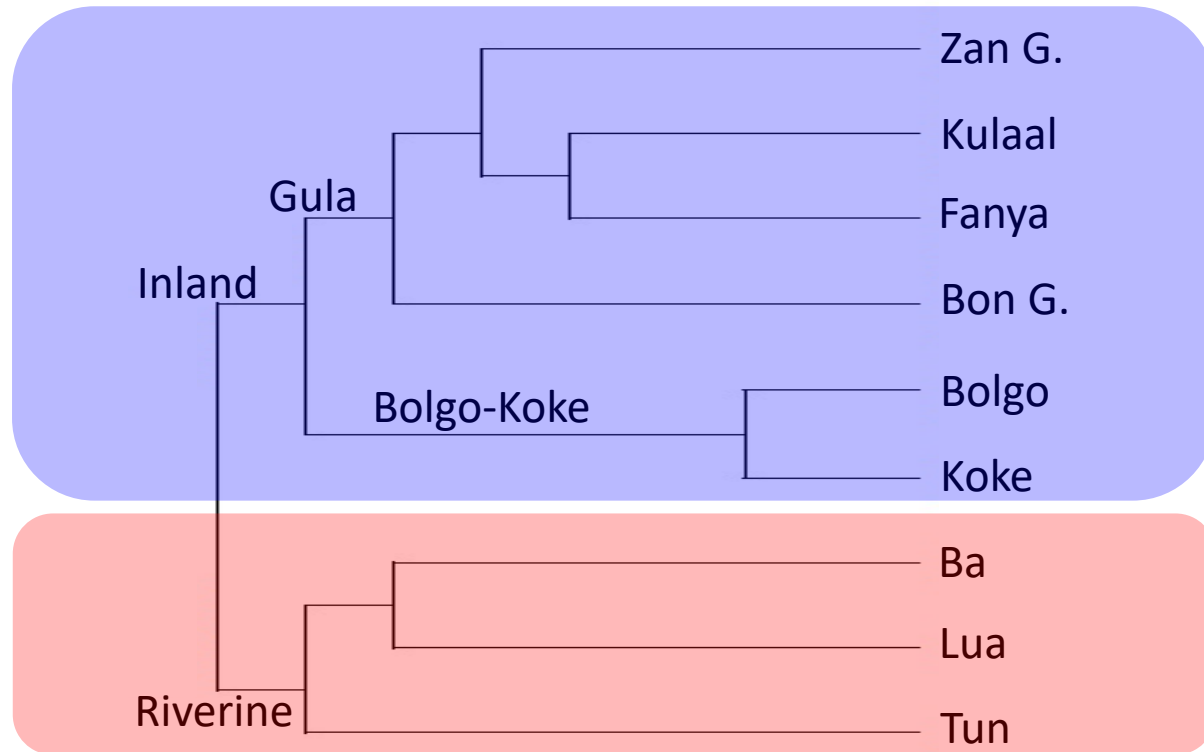

Central African Interior Vowel zone

- No ATR
- Interior vowels

2 Vowels

- ATR contrast and harmony
- No interior vowels

- No ATR
- Interior vowels

2 Vowels

- Riverine are areally aligned with Central African area where they are spoken:
 - Vowels: no ATR, interior vowels
 - Consonants: 4-way contrast (vl, vd, implosives and prenasalized)
 - Tone: three tone heights
- Inland Bua languages have an areally unexpected phonological profile:
 - Vowels: ATR contrast and harmony, no interior vowels
 - Consonants: two-way laryngeal contrast in plosives (no implosives)
 - Tone: only two contrastive tones in Gula

2.1 Vowels: Riverine

East
Chadic A:

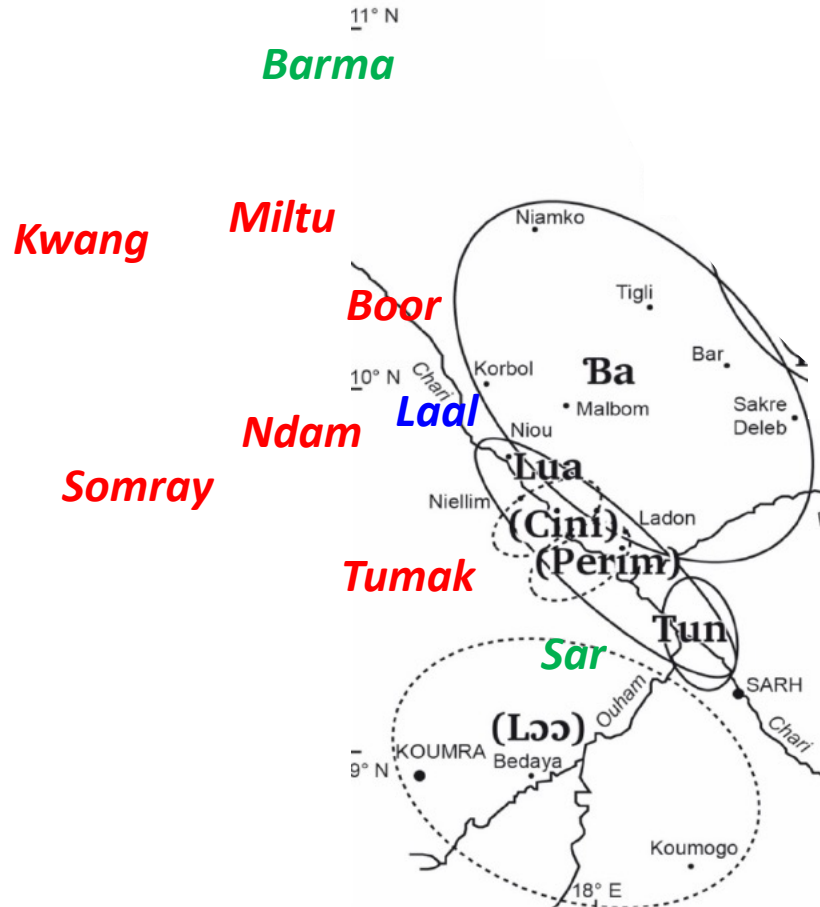

i	ɨ	u
e	ə	o
(ɛ)	a	(ɔ)

Laal:

i	y	ɨ	u
e	ø	ə	o
ɛ	œ	a	ɔ

Barma,
Sar
(SBB):

i	[ɨ]	u
e	(ə)	o
	a	ɔ

Lua:

i	ɨ	u
e	ə	o
ɛ [ia]	a	ɔ [ua]

Ba:

i	[y]	[ɨ]	u
e	[ø]		o
ɛ	[œ]	a	ɔ

Tun:

i		u
e	[i~ɨ~ə]	o
ɛ	a	ɔ

2.2 Vowels: Inland

Saba (East Chadic B):

i		u
e	ə	o
	a	

Other East Chadic B + Arabic:

i		u
e		o
	a	

Peripheral Sara :

i		u
e		o
ɛ		ɔ
	a	

Bolgo (North):

i		u
I		U
e		o
ɛ		ɔ
	a	
	Λ	

Bolgo (South) + all Gula:

i		u
I		U
e		o
ɛ		ɔ
	a	
	(Gula)	

2.3 Vowels: Proto-Bua

- **Proto-Bua had ATR contrast & harmony, and no interior vowels**
- **Inland languages have retained** this system (minor changes only)
- **Riverine languages** changed their profile due to contact with Chadic, Laal, and Sara languages → **alignment to Interior Vowel zone**
- (Unanswered question: how to explain that proto-Bua managed to maintain its ATR system, likely inherited, while being spoken in the middle of the Central African ATR-deficient zone?)

2.4 Steps of change: ATR > INT in Riverine

- Case study: Proto-Bua

Tentative reconstruction:

- ATR harmony
- [+atr] counterpart of /a/ is either /e/ or /o/
- Same system as Gula languages

- *ɪ > e, *ʊ > o merger = loss of ATR contrast
- ATR harmony > height harmony & ablaut
- *a-*o pairing regularized to a-ə or ɔ-o

- Innovation of central vowels /ə/ and /ɨ/

2.4 Steps of change: ATR > INT in Riverine

- First step: loss of ATR contrast
 - *ɔ̄, *o > o merger in Riverine

	'give birth'	'ear' (sg/pl)	'body'	'tie'	'take from'	'seize'
Proto-Bua	*ɔ̄	*ɔ̄	*ɔ̄	*o	*o	*o
Fanya	tɔ̄y	tɔ̄ / tɔ̄y	lɔ̄úrɛ	ɓó	kó	hyó
Kulaal	tɔ̄í	tó / tú	yòùt	pò	kó	hó
Zan Gula	tɔ̄y	tɔ̄ / tɔ̄y	rɔ̄uɔ̄ɛ	bɔ̄ɔ̄	kɔ̄ɔ̄ (~ kɔ)	sɔ
Proto-Riverine	*o	*o	*o	*o	*o	*o
Lua	tɔ̄y	túlā / tórí < *tólā	ndúlá / ndórí < *ndólá	ɓɔ̄w	kó	sò
Ba (Magal)	tɔ̄y	tów̄ / tóȳ	--	ɓòw	kó	sɔ̄w
Ba (Korom)	tɔ̄y	tóɔ̄ / tóȳ	--	ɓɔ̄ɔ̄	kɔ̄ɔ̄	
Tun	tārɔ̄ < *toro?	tɔ̄y / tɔ̄n	lɔ̄ɔ̄			

2.4 Steps of change: ATR > INT in Riverine

- First step: loss of ATR contrast
 - ***I**, ***e** > **e** merger in Riverine

	‘hunt’	‘cook’	‘tree’	‘chop’	‘hippopotamus’
Proto-Bua	* I	* I	* I	* e	* e
Fanya	nín̄	tírí	tîw	té	kéndì
Kulaal	nèn (I = ‘e’ / nas)	tíí	téú (= tíú?)	--	(ñán̄)-kènè
Zan Gula	n̄n̄	tiri	tu < *t̄iú?	--	--
Proto-Riv.	* e	* e	* e	* e	* e
Lua	nēn	tár	tílā < *télā (pl: tērī)		kàn
Ba (Magal)	nēn	tér	tílā < *télā (pl: tēr)	tēy	kw̄īlī
Ba (Korom)			télā (pl. tēr)		--
Tun	nēn	tēl	tógā < *tégā?	tēy	cēn

2.4 Steps of change: ATR > INT in Riverine

- Second step: development of interior vowels

/ị/

1. **ʊ*, **u* > *ị* / C_B# (dissimilation, not regular)

	‘oil’	‘to spit’
Proto-Bua	* <i>u</i>	?
Fanya	n <i>ú</i> mí	
Kulaal	nóm (<i>u</i> = ‘o’ / nas)	tòpì, ṭòp̣ìp̣è
Zan Gula	n <i>u</i> me	ṭòbsi
Proto-Riv.	* <i>u</i>	* <i>u</i> ?
Lua	n <i>ị</i> m̄	ṭịb
Ba (Magal)	n <i>ú</i> mū	(?) ṭūmū
Tun	n̄m̄	

2.4 Steps of change: ATR > INT in Riverine

- Second step: development of interior vowels

/ị/

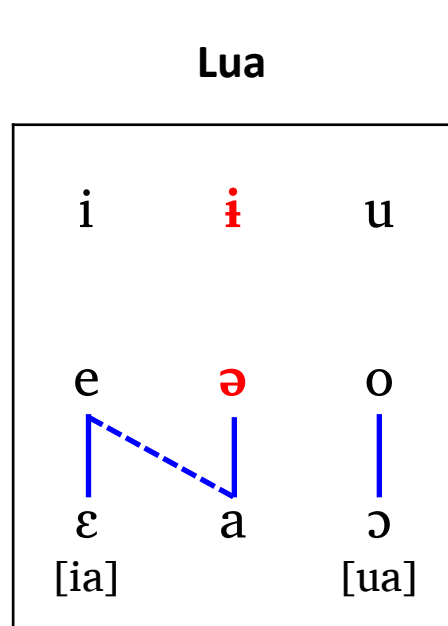

1. **ʊ*, **u* > *ị* / C_B# (dissimilation, not regular)

2. Loanwords, e.g. /d̄im/ 'Barma, muslim person'

- Laal /d̄im/
- Boor /d̄imè/
- Sar /d̄um/

2.4 Steps of change: ATR > INT in Riverine

- Second step: development of interior vowels

/ị/

1. **ʊ*, **u* > *ị* / C_B# (dissimilation, not regular)

2. Loanwords

3. Most frequent occurrence = /ị/ → [ị] / __Ca

- /mĩnā/ → [ṃĩnā] ‘hoe’ cf. pl. [ṃĩnī]
- /bīrā/ → [ḅīra] ‘net’ cf. pl. [ḅīrī]
- /kìráŋ/ → [ḳìráŋ] ‘basket sp.’ cf. pl. [ḳìrīŋ]

(same in Ba, Laal, Barma)

2.4 Steps of change: ATR > INT in Riverine

- Second step: development of interior vowels

Lua

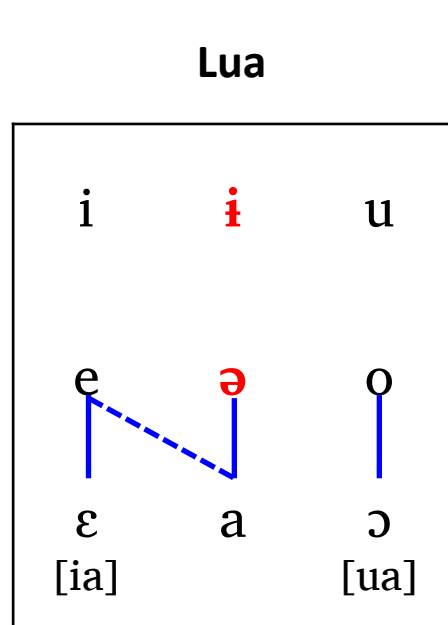

/ə/

1. Proto-Riverine *e, *o > ə in many CVC words (not fully regular)

	'hippopotamus'	'to cook'	'man'	'to open'
Proto-Bua	*e	*ɪ	*o	*o?
Fanya	kéndì	tírí	bòrìyò	
Kulaal	(ñán)-kènè	tíí	pòìl	
Zan Gula		tɪɾɪ	bōrí	tokiŋ
Proto-Riv.	*e	*e	*o?	*e
Lua	kən	tər	bər	təŋ
Ba (Magal)	kwĩĩlĩ	tér	búrú	tēgēr
Tun	cēñ	tēl	(ùr)-béy	

2.4 Steps of change: ATR > INT in Riverine

- Second step: development of interior vowels

/ə/

1. Proto-Riverine *e, *o > ə in many CVC words (not fully regular)
2. /a/-raising: *a ~ *e replaced with /a/ ~ /ə/:

- Raising triggered by PL sfx /-Gi/ (height harmony):

bàà / b	ə̀ə̀gí	‘father’
gàn / g	ə̀nŋgì	‘stomach’
hám / h	ə̀mŋgí	‘beer’

- Morphological raising marking PL:

lág / l	ə̀g	‘hip’
kàr / k	ə̀r	‘monitor lizard’
yà / y	ə̀	‘cereal’

2.4 Steps of change: ATR > INT in Riverine

- ATR harmony > height harmony & morphological raising (ablaut)

2.4 Steps of change: ATR > INT in Riverine

- ATR harmony > height harmony & morphological raising (ablaut)

Proto-Bua

- ATR harmony, [+ATR] dominant (same in all Inland)
- Fanya examples with [+ATR] plural suffixes :

	SG		PL /-i/, /-nyi/	
ɪ/i	nín-ú	/	nín-í	'body, cadaver'
ʊ/u	búy-ú	/	búy-í	'animal fat'
ɛ/e	hwèɾ-wè	/	hwèɾ-ì	'Tilapia sp. (fish)'
ɔ/o	hòòn-ò	/	hòn-nyì	'hare'
a/e	mìyàà-kù	/	mìyèèk-ì	'centipede'
a/o	lààɾ-à	/	lòòɾ-ì	'cow'

2.4 Steps of change: ATR > INT in Riverine

- ATR harmony > height harmony & morphological raising (ablaut)

Lua

- No ATR, but height harmony (sfx) and ablaut (no sfx)

P-Bua	P-Riv.	SG		PL	
*I/*i	—	—	/	—	
*U/*u	—	—	/	—	
*ε/*e	ia/e	tiā-l piǎg	/	tē-n-ī pèg	'Tilapia sp. (fish)' 'shoulder'
*ɔ/*o	ua/o	kuàr kuà	/	kòr-gì kò	'buffalo' 'snake'
*a/*e	a/e	bā-l ndā	/	bē-n-ī ndē	'fish sp.' 'bird sp.'
	a/ə	bàà lág	/	bàə-gí lóg	'father' 'hip'

2.4 Steps of change: ATR > INT in Riverine

- ATR harmony > height harmony & morphological raising (ablaut)

Lua

- No ATR, but height harmony (sfx) and ablaut (no sfx)

P-Bua	P-Riv.		SG		PL	
*a/*o	*a/*ə	Fanya:	nyǎmm-ì	/	nyǒmm-ì	'animal, meat'
		Lua:	nyàm	/	nyəm	'animal, meat'
	*ɔ/*o	Fanya:	káàr-è	/	kóòr-ì	'buffalo'
		Lua:	kuàr	/	kòr-gì	'buffalo'

3 Areal alignment of plosive contrasts

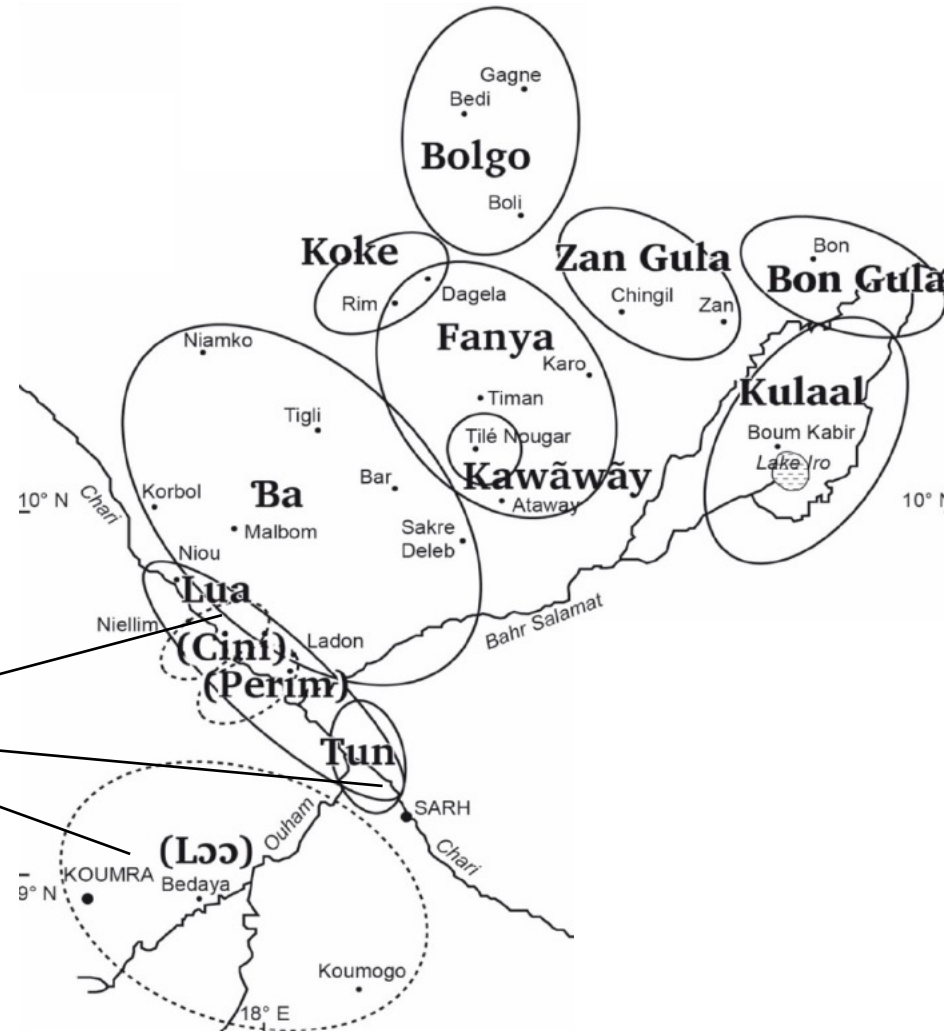

3 Plosives

- Stem-initial plosives = maximal inventory
 - Stem-initial prominence effects at work in all Bua except Gula languages.
- Wide disparity in terms of
 - Number of contrastive series: **1 ~ 4**
 - Number of individual plosives: **4 ~ 14**

3.1 Plosives

Lua & Tun (& Loo)
(4 series /14 phonemes)

p	t	c	k

Tun	—	kɔ̀̀	gèè	gūr	—

3.5 Plosives: Proto-Bua > Lua, Tun

Proto-Bua (3/10)

*p	*t	*c	*k
*b	*d	*j	*g
*ɓ	*ɗ		

Lua, Tun (4/14)

p	t	c	k
b	d	j	g
ɓ	ɗ		
mb	nd	ɲj	ŋg

3.5 Plosives: Proto-Bua > Lua, Tun

- Whence /p/?

- Lua:

- *p > h/__[+round],
- but *p maintained before unrounded vowel

	moon	mortar
Proto-Bua	*pεε-	*pɔɔ-
Lua	piāā	huáál

- /h/ phonemicized:

- *s, *c > /h/
- loans, e.g. **hálí** ‘tree sp.’ vs. **pār** ‘follow’

- Tun:

- *p > h
- /p/ rare, attested in words with no obvious Bua cognates
 - páā ‘engagement’
 - pàlpày, pàrpày ‘fish sp.’
 - pāārī ‘to criticize’
 - pīrgī ‘folie’

3.5 Plosives: Proto-Bua > Lua, Tun

- Whence /c/?

Proto-Bua *c > s

	dog	smoke
Proto-Bua	*ca-	*ciim-
Lua	sàw	síim
Tun	—	sēm

Position filled by *k > c / __[+front]

to cry	crocodile	to turn
*ke/i-	*kiib-	*kiir-
cəŋ	cìbà	cēērī
cī	cēn	

k/c phonemicized:

- *e > ə, e.g. cəŋ ‘to cry’ vs. kəy ‘what’
- loans, e.g. kédē ‘one’ (< Barma) vs. cēl ‘fish sp’

- → pressure to maintain the system, by filling the gaps created by prior sound changes

3.5 Plosives: Proto-Bua > Lua, Tun

- Prenasalized plosives
 - cannot be reconstructed to Proto-Bua
 - attested only in Lua, Tun, and Lɔɔ (Lɔɔ corpus = only 47 words)
 - rare in both Lua and Tun, e.g. Lua:
 - mb = 0.7% of stem-initial Cs in lexicon
 - nd = 2.8% “ “
 - nj = 0.5% “ “
 - ŋg = 2.5% “ “
 - mostly loanwords

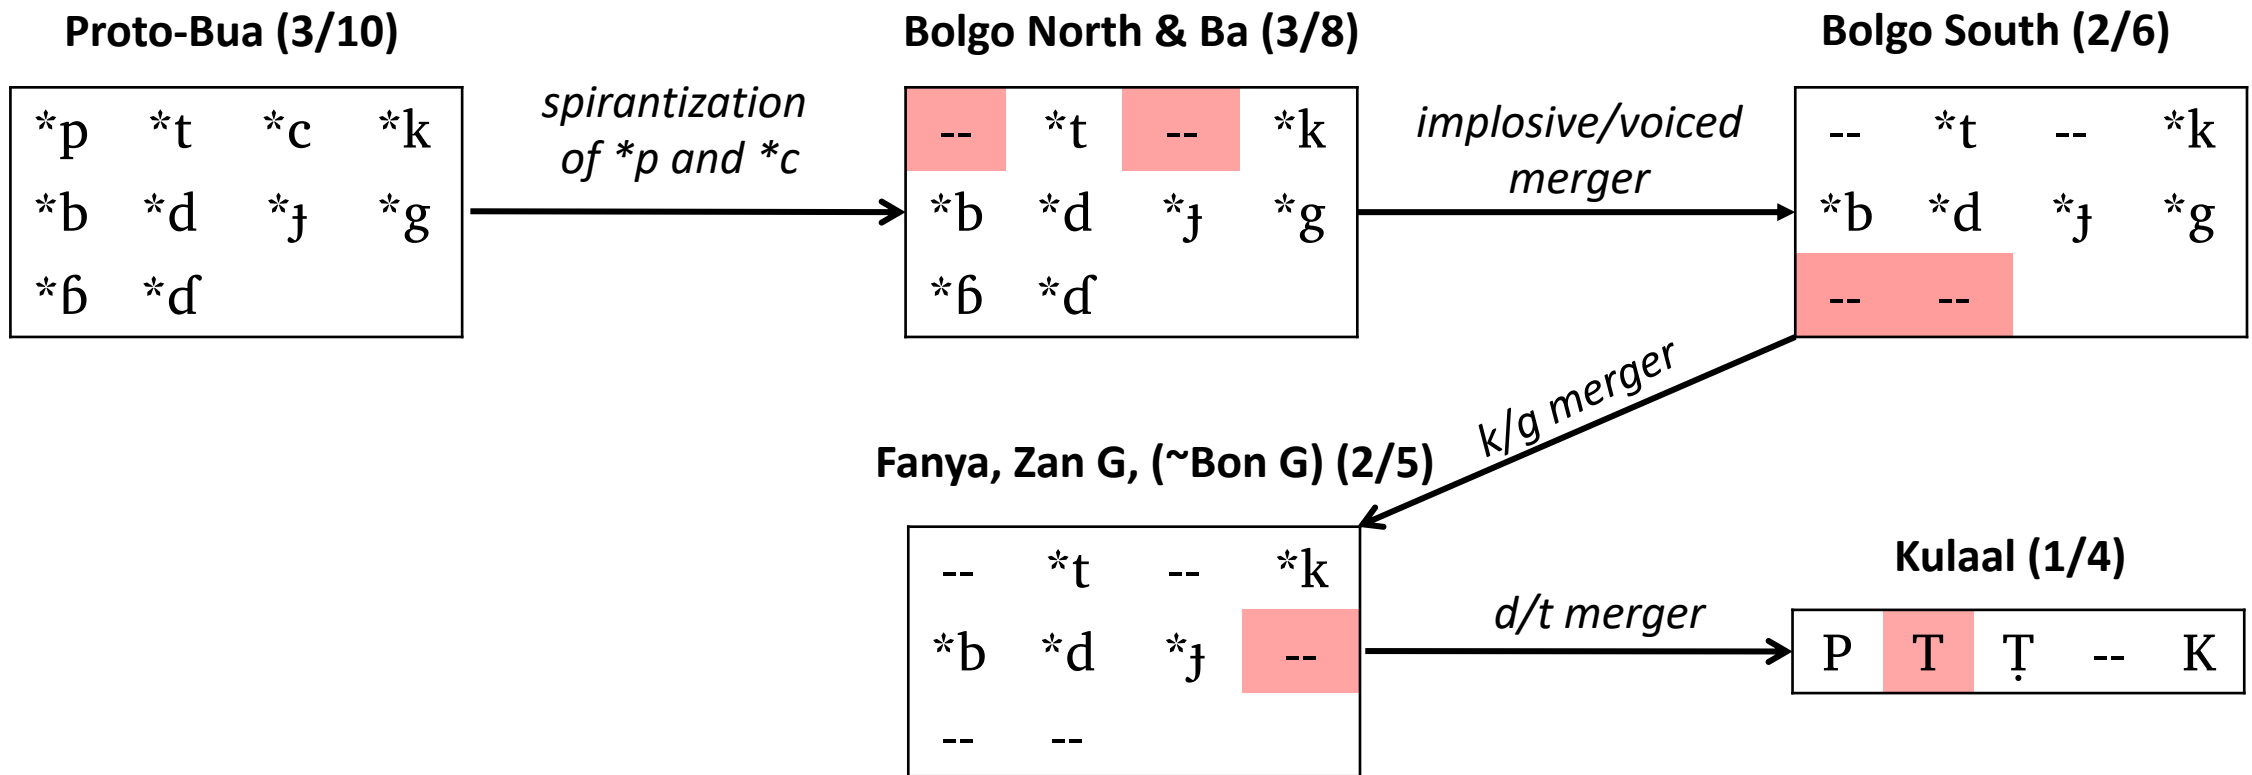

3.5 Plosives: Proto-Bua > Lua, Tun

- Lua innovated /nd/ through regular *r > nd change:

	hunger	knee	name	body	two
Proto-Bua	* r ɔl-	* r ul-	* r il-	* r oɔd-	* r i-
Fanya	ɽòllè	ɽúllé	ɽíllé	lóóré	ɽîɽú
Kulaal	yòl	yúl	ííl (< yíl ?)	yòòt	
Zan Gula	r ulle	r ulle	r ínú	r oɔde	r isi
Bon Gula				r o	
Bolgo S		ɽúl	ɽíl	lòòr	r edi
Bolgo N	lòl	r úúl	r uul	lōr	r ed
Lua	nd ùlà	nd únngū	nd íl	nd úlá	nd írí
Ba	r ùlā	r úlū	r ílí	r éé	í- r ī
Tun	--	lūngū	lī	lōō	à- r ī

3.6 Plosives: Proto-Bua > Inland

- Schematic steps involved in series reduction, illustrated:

3.6 Plosives: summary

Ba (3/8)

--	t	--	k

4. The role of contact

4 The role of contact

Table 1: Scalar levels in the analysis of linguistic contact (Muysken 2007, 2008: 5)

Level	Space	Time	Sources	Disciplines	Scenarios
Person	Bilingual individual	0–50 years	Recordings, tests, and experiments	Psycho-linguistics	Brain connectivity
Micro	Bilingual community	20–200 years	Recordings and fieldwork observations	Socio- and anthropological linguistics	Specific contact scenarios
Meso	Geographical region	Generally 200–1000 years	Comparative data; historical sources	Historical linguistics	Global contact scenarios
Macro	Larger areas of the world	Deep time	Typological, genetic, archeological data	Areal typology	Vague or no contact scenarios

- At the meso- and macro-level, areal effects are “often due to language contact but **importantly must not be reduced to it**” (Güldemann 2018: 446)

4 The role of contact

- Profile changes in Riverine Bua are most likely explained by contact
- Small-scale multilingualism (Lüpke 2016)
 - very frequent intermarriage between Ba, Lua, Laal, Boor, and Ndam speakers
 - patrilocality → women bring their language, children acquire both mother and father's lg.
 - Villages are constantly multilingual

4 The role of contact

- Loanwords are not the main cause of change
 - They reinforce changes, help phonemicize newly created allophones, etc.
 - Changes are mostly internal (*r > nd in Lua, *k > c/__[front] in Lua and Tun)
- Likely at work: **shift-induced substrate effects** (Thomason & Kaufmann 1988): Chadic, Laalic, and Sara speakers are likely to have shifted to Riverine Bua languages at different times, importing aspects of their phonology.

Conclusion

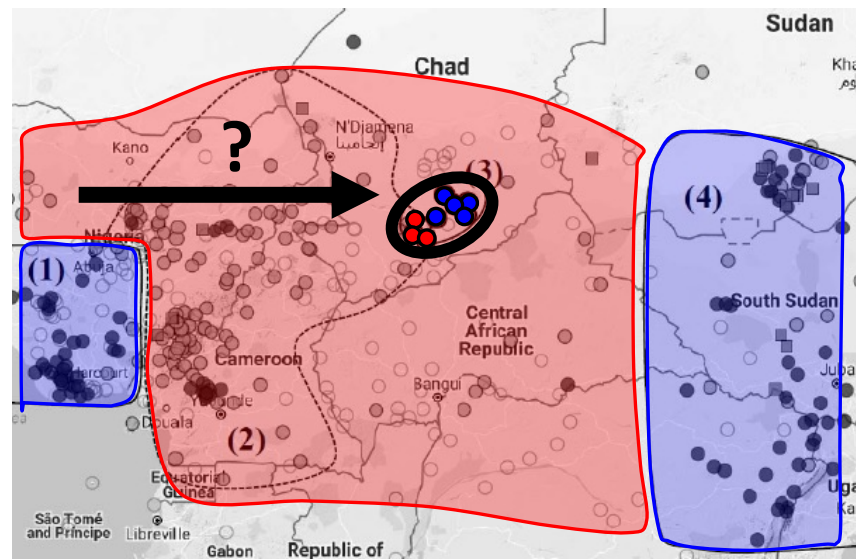

- Riverine Bua, especially the south-westernmost Lua and Tun, adapted their phonological profile to their neighboring languages (Chadic, Laal, Sara).
- This involved major changes / restructurations:
 - loss of ATR
 - gain of interior vowels
 - gain of prenasalized stops
 - (also gain of a third tone height: Proto-Bua had only two tones)
- As well as some conservatism (as opposed to Inland Bua):
 - 3 plosive series maintained (+ extended to four with prenasalized)
 - “Depleting” sound changes remedied: *c > s, replaced by *k > c/__[front]

Conclusion

- Languages change profiles when changing areas
 - Areal signals are strong and stable: they resist migration and language shift (percolate up through layers of population movements)
 - Contact is a key factor in such profile changes
 - Small-scale multilingualism (Lüpke 2016)
 - “Shift-induced substrate interference” (Thomason & Kaufman 1988)

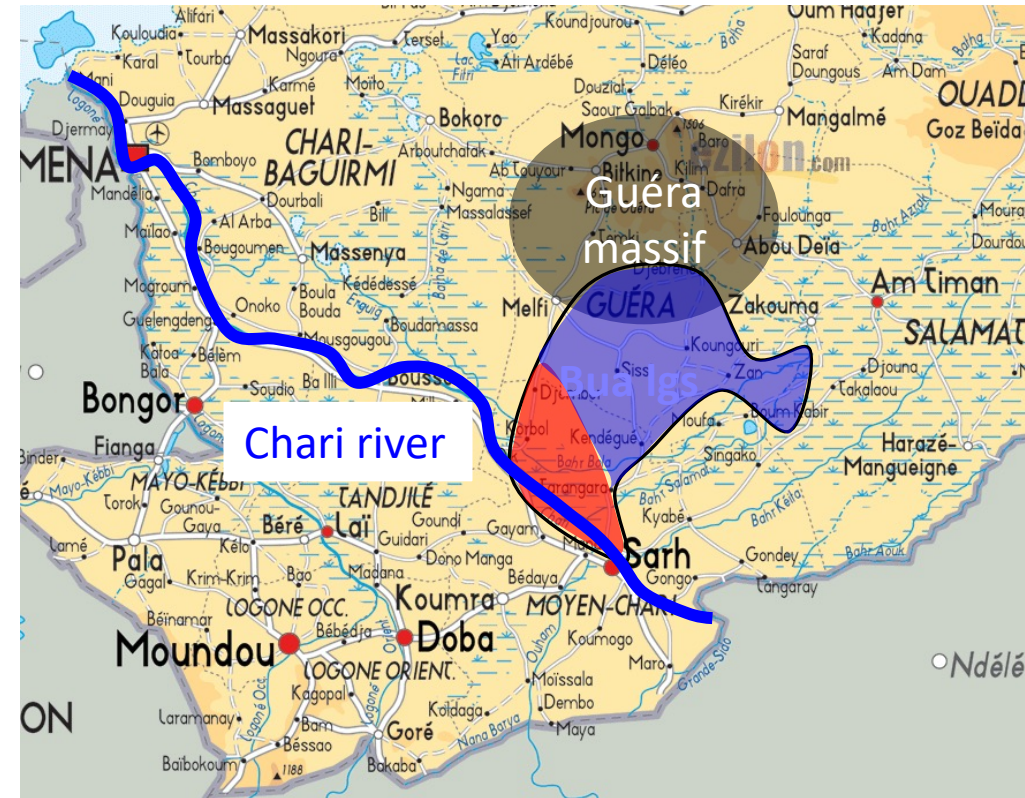

Conclusion

- Proto-Bua (and Inland languages) is areally odd
 - Migration from before the creation of the Central African ATR-deficient and Interior Vowel zones?

Conclusion

- Proto-Bua (and Inland languages) is areally odd
 - Inland languages are in a cul-de-sac between **the Guera massif and flood zones to its south** = a refuge area
 - Inland languages conservative, less areally influenced
 - **The Chari river** = crossroads, contact area
 - Riverine languages more prone to areal alignment

Thank you!
